RESEARCH INTERESTS

My research interests span Distributed System, Operating System, and Computer Architecture, with a focus on building fast and reliable systems for datacenters. I work at Wuklab, UCSD, under the supervision of Prof. Yiying Zhang.

EDUCATION

University of California San Diego — 2019-2022
Ph.D. in Computer Science and Engineering — (expected)

Purdue University — 2016-2019
Ph.D. in Computer Engineering (Transferred to UCSD)

Institute of Computing Technology, Chinese Academy of Sciences — 2014-2016
Research Assistant

Beijing University of Aeronautics and Astronautics — 2010-2014
B.E. in Computer Engineering

INDUSTRY EXPERIENCE

Research Intern**, VMware Research** — Palo Alto, CA, Summer 2019
Mentor: *Marcos K. Aguilera*

Research Intern**, VMware Research** — Palo Alto, CA, Summer 2018
Mentor: *Stanko Novakovic*

PUBLICATIONS

Shin-Yeh Tsai, **Yizhou Shan**, Yiying Zhang, "**Disaggregating Persistent Memory and Controlling Them Remotely: An Exploration of Passive Disaggregated Key-Value Stores**", 2020 USENIX Annual Technical Conference (**ATC '20**)

Yizhou Shan, Yilun Chen, Yutong Huang, Sumukh Hallymysore, Yiying Zhang, "Lego: A Distributed, Decomposed OS for Resource Disaggregation", Poster at the 26th ACM Symposium on Operating Systems Principles (***SOSP '17***)

Yizhou Shan, Sumukh Hallymysore, Yutong Huang, Yilun Chen, Yiying Zhang, "Disaggregated Operating System", Poster at the ACM Symposium on Cloud Computing 2017 (***SoCC '17***)

AWARDS

2020 Facebook Fellowship Runner Up
SYSTOR'19 Best Paper Award
OSDI '18 Jay Lepreau Best Paper Award
OSDI '18 Student Travel Grant
SOSP '17 Student Travel Grant
SoCC '17 Student Travel Grant

RESEARCH EXPERIENCE

Programmable Disaggregated Memory System (Under Submission)   2018-Current
Purdue University and UCSD
We are building a hardware-based disaggregated memory system using FPGA. This is a follow-up work of LegoOS. The mComponent provides basic remote memory primitives, some higher-level interfaces such as key-value store.

Serverless on Disaggregated Datacenter (WIP)   2019-Current
UCSD
We are trying to demonstrate when serverless means no server. Instead of using monolithic machines, we explore the possibility using disaggregated datacenter. Instead of optimizing existing VM and container technologies, we explore a new way to run serverless function: using library OS. The project involves heavy kernel and distributed systems hacking. We are targeting OSDI'20.

An Operating System For Cloud FPGA (Concluded)   2019-2020
UCSD
We are building a new operating system for cloud FPGA. This new runtime overcomes the limitations of static compile-time approaches and provides a set of new services. We will show how this helps reduce cost and enable new FPGA apps.

Optimize Page Faults   2019 May-Aug
VMware Research
Ancient old page fault handling is the driving wheel for many emerging datacenter systems and applications. But the page fault handling mechanism was designed for millisecond-level disk operations, there is a performance mismatch when it is used by fast devices like RDMA, or PM. We are now trying to close the gap.

LegoOS: A Disaggregated Operating System   2017-2018
Purdue University
We propose a new OS model called the splitkernel to manage disaggregated systems. Splitkernel disseminates traditional OS functionalities into loosely-coupled monitors, each of which runs on and manages a hardware component. Using the splitkernel model, we built LegoOS, a new OS designed for hardware resource disaggregation.

Hotpot: Distributed Shared Persistent Memory   2016-2017
Purdue University
We propose Distributed Shared Persistent Memory (DSPM), a new framework for using persistent memories in datacenter environments. We designed and implemented *Hotpot*, the first DSPM system in Linux kernel. Hotpot provides low-latency, transparent memory accesses, data persistence, data reliability and high availability.

Non-Volatile Memory (NVM) Emulator   2015-2016
Institute of Computing Technology, Chinese Academy of Sciences
We designed and implemented a NVM emulator in Linux kernel, which leverages Intel's Performance Monitoring Unit to emulate NVM's slower read/write latency and smaller bandwidth on physical DRAM. This emulator runs on bare-metal x86 machines.

ARMv8 CPU Project   2013
Institute of Computing Technology, Chinese Academy of Sciences
I participated in the Register-Transfer Level design and verification of some blocks within cache unit and load-store unit. It is commercial project collaborated with Huawei.
